

SILT FENCE

A silt fence is a temporary barrier designed to retain sediment and control erosion on a construction site. The fence is made of woven, synthetic filtration fabric that is supported by wood or steel posts. The fence prevents the downhill flow of sediment while letting water runoff pass through the fabric.

FILTRATION FABRIC

Geotextiles can be woven, knitted or non-woven. Varying polymers and manufacturing processes result in an array of geotextiles suitable for a variety of civil construction applications.
